

AutoDeFi LaunchPad (Hedera EVM)

Delightful token launches. Transparent price discovery. Hedera-speed trading.

Problem

- Launching a community token is fragmented (wallets, contracts, indexers, UI)
- Opaque early-stage price discovery and liquidity signals
- High friction and fees deter small communities and experiments
- Builders spend days wiring infra instead of shipping value

Solution

AutoDeFi LaunchPad compresses token creation and early trading into a single flow:

- Create token (name, symbol, links) and initial HBAR in one step
- We deploy ERC-20 + bonding-curve pool via Factory
- Buy immediately, with algorithmic price discovery (XYK + virtual reserves)
- "Graduation" threshold prepares projects for DEX routing/liquidity

Demo Flow (Creator)

Architecture (Hedera EVM)

What We Built

- Solidity contracts: Factory, BondingCurvePool (XYK + virtual reserves), LaunchPadToken (ERC-20)
 - Frontend: Next.js 15 + React 19 UI with wallet, launch, trading, portfolio
 - Indexer: Cron-driven snapshots for price/volume/trades and graduation state
 - Database: Prisma + Postgres for persistence and analytics
 - Network: Hedera Testnet (RPC: Hashio) — Factory 0xEEBed6dC5e12Ee6379A59c7C35fF80cE7853FE7B
-

Key Features

- One-click token launch on Hedera EVM
- Algorithmic price discovery via bonding curve
- Graduation threshold for DEX readiness

- Real-time metrics: price, 24h volume, trade count, market cap proxy
 - Rich UX: animated dashboards, explorer links, toasts, status badges
 - Portfolio view for balances and activity
-

Why Hedera

- Fast finality, very low predictable fees, energy-efficient
 - EVM-compatible (tooling, audits, wallets)
 - Great UX for micro-transactions and community tokens
-

Market & Opportunity

- Community / meme / experimental tokens: massive creator + trader demand
 - Pain today: complex launches, poor transparency, high friction
 - Our edge: cohesive experience + fair, transparent price signals + Hedera cost profile
-

Business Model (Options)

- Protocol fee on initial buys via bonding curve
 - Listing/launch fee for premium features (branding, whitelists, vesting)
 - Value-add services post-graduation (DEX routing, analytics, alerts)
-

Go-To-Market

- Launch cohorts with Hedera ecosystem partners and communities
 - Creator onboarding via templates, guides, and social campaigns
 - Integrations with wallets, explorers, and DEXs for seamless discovery
-

Roadmap

- DEX router integration for post-graduation swaps
 - Advanced analytics: price impact, depth, velocity, trend alerts
 - Creator tooling: vesting, whitelists, anti-bot guardrails
 - Social features: referrals, follower feeds, token-gated drops
-

Competitive Landscape

- Bonding-curve launchers on other chains (gas-heavy, fragmented UX)
 - Centralized token launchpads (custodial, opaque)
 - Our moat: cohesive UX, Hedera economics, transparent on-chain metrics, graduation path
-

Risks & Mitigations

- Smart contract risk → audits, battle-tested patterns, strict upgrades
 - Liquidity fragmentation → graduation to DEX + routing
 - Regulatory uncertainty → non-custodial design, community-centric tooling
-
